draws us a radiating figure, from which they equally project (*Zur Stammgeschichte der Papilioniden*, p. 492). Such progeny, so dissimilar in essentials, cannot have had a common womb. But when we examine the pale Parnassian from northern meadows, and the black and gold Ornithopteron from openings in the tropical forest, then the short anal vein on their fore wings reveals in both cases the blood of the Papilionides, the proof of common descent and of a separate origin from the Pierids and the rest of the butterflies. It is Dr. Spuler (*l. c.*) who derives *Ornithoptera* from Papiliolike forms, so that I am totally at variance with this author in my views as to the classification and phylogeny of the Papilionides. While Dr. Spuler regards *Ornithoptera* as an end form, terminating a Papilionid branchlet, I consider it to represent an initial type coming nearer to the primitive form of the diurnal Papilionides.

I have been thus explicit in order to give clearly the radical points of distinction between the classification of the diurnals by any other author and my own.
